

Mains PIR

6.1

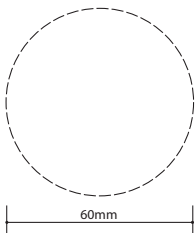

The Intelligent Solutions mains rated passive infra-red detector provides occupancy information to the Spider box range of products. The detector picks up moving body heat to sense when an area is occupied. A time delay is incorporated in the unit. The time delay is re-started every time movement is detected. This means that the occupant can be still for the duration of the time delay before an unoccupied signal is sent. Photocell facility is available on some devices. The sensor can be supplied with Hand held over-ride or dimming or both.

Different types of device are available depending on what type of lighting control module is being used or if the PIR is a stand alone or with Infra-red over-ride device.
